Reducing Food Waste

Food waste in shipping results in billions of dollars in losses annually and affects supply chains worldwide.

IoT and container telematics help monitor and control conditions inside containers, significantly reducing spoilage.

Cost Savings
Telematics-Driven Efficiencies

IoT, telematics and AI optimize operations, reducing unnecessary costs and maximizing equipment lifespan.
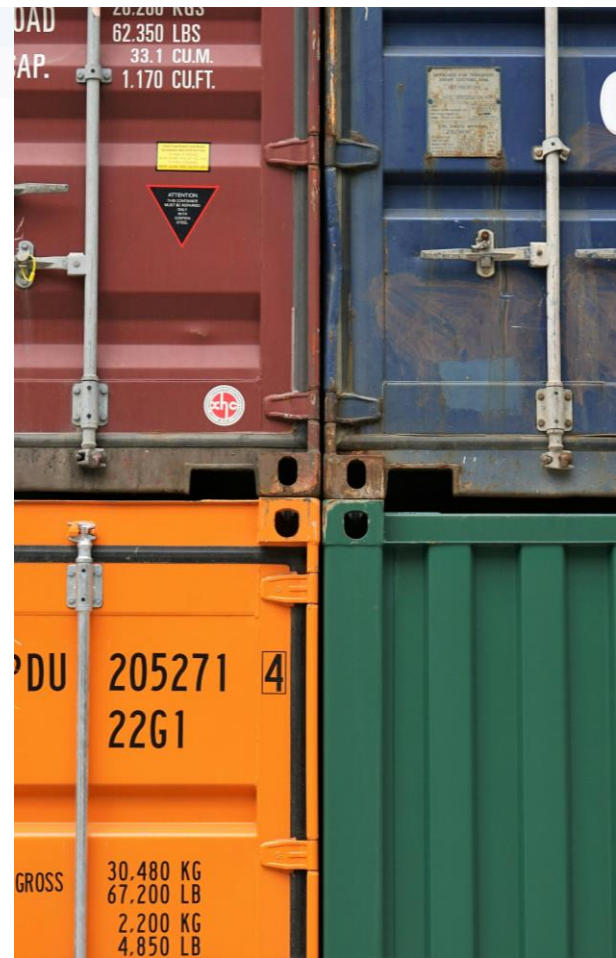

- Remote PTI reduces labor costs and the need for physical inspections.

- Equipment health monitoring in real time, predicting potential failures before they occur.

- Fleet-wide analysis to optimize maintenance schedules, ensuring reefers are in peak condition without unnecessary servicing and Minimizes wear and tear, extending the lifecycle of expensive assets and maximizing return on investment.

Enhanced Security

Security is a key concern in intermodal shipping.

Increased cargo security using telematics, reduces losses from theft and tampering, and builds trust with customers through transparent, secure shipping operations.

A smart 360 solution

- Advanced telematics devices with multi-sensor capabilities.

- Seeing every angle of container tracking.

Thank you
